Letters from Home Set Constructors

THE SET BUILDER'S PROGRESS

Editor, Radio News:

I wonder if the manufacturers realize the business-creating force of a publication like RADIO NEWS? Take my case for instance: in December, 1925, a friend introduced me to his two-tube set and to RADIO NEWS of that month. That issue contained the "Regenerative Interflex" story. I built this receiver. The following one contained Mr. Harris' "Balanced Regenerator" story, and I built that set also with good success, as I had done with the Interflex.

A little later a friend told me very enthusiastically of results he was getting with a Browning-Drake hook-up; and just then you published a B.D. constructional article. So I tried that one also. Since that time I have made up four of these sets for friends who are, I believe, "in radio" solely by reason of having caught the germ from me.

Of course, all of this activity means the marketing of quite a little radio merchandise, and all from a little spark kindled by RADIO NEWS.

I am now using a set consisting of the Harris Balanced Regenerative Detector, preceded by a tickler reversed-feedback stage and with two transformer-coupled A.F. stages following; and this I think the best of the four-tube hook-ups.

C. E. LLOYD,

R. F. D. 1, Spokane, Wash.

HOW GEORGE DID IT

Editor, Radio News:

Looking over your January issue, I came across the story "The Invisible Net." After reading it,

I thought of a little outfit I have attached to my receiving set. I am enclosing a diagram of the hook-up; it is a regular two-tube amplifier. The microphone is an ordinary 1500-ohm telephone receiver. At the output of the amplifier is a D.P.D.T. switch, so that either the receiving set or the miniature "broadcaster" can be connected to the horn.

As I am an experimenter by nature and a radio repair and service man by trade, I have a chance once in a while to make up something of this sort. I have a Browning-Drake receiver—which is very

The diagram shows the outfit as originally made up, but I have since changed it so that I can connect either of two microphones; one at the set for the operator, and one in another room made up as a studio. Also I have a set of earphones connected with the horn so that the operator can listen to what is going to the horn. I have also two small switches to cut out either the earphones or the horn. At the entertainments I used a loud speaker that looks like a microphone for the studio microphone of the outfit. If the loud speaker is connected to the input of the outfit diagrammed, conversation from the room where the loud speaker is can easily be heard. Hoping this will enlighten some of the readers of "The Invisible Net."

A. W. GREENLAW,
51 Willard St., Malden, Mass.

THE FILADYNE CIRCUIT

Editor, Radio News:

Just a line or two that may let the people back in the old country know that we get quite a bit of information from RADIO NEWS. Being a bunch of freshly-graduated amateurs from the division radio school, we try almost any old hook-up. And one we tried is the Filadyne circuit appearing in the November issue of RADIO NEWS. There were no data given, but we went ahead and made it. And it worked fine, using about 85 turns of No. 21 D.C.C. wire on the primary and secondary, 130 turns of No. 26 D.C.C. for the chokes; also VT1 tube, .0025-mf. fixed condenser across the phones, these having 1000 ohms D.C. resistance. Had 45 volts on plate and 4 volts on filament.

(Continued on page 1270)

Diagram of Mr. Greenlaw's first hook-up; the "mike" is a common 1500-ohm phone receiver.

popular in this district—and this outfit all in the same cabinet. I have used this at five church entertainments.
